Pergo luxury vinyl plank (LVP) requires an angled or rotational insertion rather than a flat, closed-joint push. The rigid locking profile relies on physical clearance to let the tongue slide into the groove at a 20- to 45-degree angle. Forcing planks flat together in a "closed joint" blocks the necessary rotation, which breaks the fragile vinyl lip and prevents a secure lock. YouTube · So That's How... +4

Why Closed Joints Fail

- **Angle Requirement:** The tongue must enter the groove from above at an angle to engage the inner hook.
- **Blocked Rotation:** Laying planks flat first traps the tongue outside the receiving channel.
- **Damaged Lips:** Forcing a flat join shatters the plastic edge, leaving loose debris that jams the seam. YouTube · So That's How... +1
